Proper design of printed circuit boards can make the difference between a product passing emissions requirements during the first cycle or

not. Traditional EMC design practices have been simply rule-based, that is, a list of rules-of-thumb are presented to the board designers to implement. When a particular rule-of-thumb is difficult to implement, it is often ignored. After the product is built, it will often fail emission requirements and

With this basic understanding, circuit board designers can make trade-off decisions during the design phase to ensure optimum EMC design.

Consideration of these potential sources will allow the design to pass the emissions requirements the first time in the test laboratory. A number of
