Wrist Biomechanics: Three biomechanic concepts have been proposed: Link concept . three links in a chain composed of radius, lunate and capitate head of capitate acts as center of rotation; proximal row (lunate) acts as a unit and is an intercalated segment with no direct tendon attachments; distal row functions as unit; advantage

Biomechanics of the wrist The wrist joint is a complex linkage between forearm and hand which is capable of an impressive arc of motion yet retaining a remarkable degree of stability.

Carpal stability is derived from numerous intra-and intercarpal ligaments in addition to closely approximated wrist flexors and extensors.

Clinical interest in the wrist joint has accelerated markedly in the last two decades. Clinical diagnosis based on a greater understanding of wrist anatomy, biomechanics and increasingly sophisticated imaging techniques has markedly enhanced our ability to treat disorders of this joint.

Wrist biomechanics - SlideShare

The wrist is an ellipsoidal (condyloid) type synovial joint, allowing for movement along two axes. This means that flexion, extension, adduction and abduction can all occur at the wrist joint. All the movements of the wrist are performed by the muscles of the forearm.

The Wrist Joint - TeachMeAnatomy

The wrist has two degrees of freedom, although some say three degrees of freedom because they include the movements of pronation and supination, which occur at the the radioulnar joint. The radioulnar joint is often referred to as

Biomechanics of the Distal Radioulnar Joint - PubMed The distal radioulnar joint is an intricate part of wrist function. The radius and hand move in relation to, and function about, the distal ulna. Significant loads are transmitted to the forearm unit through the distal ulna via the triangular fibrocartilage.

to wrist biomechanics. The wrist bones are irregular in shape and are divided into two carpal rows. Radioulnarly, the proximal row consists of the scaphoid, lunate, triquetrum, and pisiform. The distal row consists of the trapezium, trapezoid, capitate, and hamate, again listed radioulnarly. Each of the five metacarpal bones, radioulnarly

Allieu¹ has estimated that one quarter of all injuries in sports occur to the wrist joint. McCue and colleagues³² proposed that wrist injuries are common in athletics because the hand is usually in front of the athlete and absorbs contact in most sports, and because the hands are used to some extent in all sports.
