Excel calculations: automatic, manual, iterative

Starting in Microsoft Excel 2002, the Range object in Microsoft Visual Basic for Applications (VBA) supports a method, Range.Dirty, which marks cells as needing calculation. When it is used together with the Range.Calculate method (see next section), it enables forced recalculation of cells in a given range. This is useful when you are performing a limited calculation during a macro, where the calculation mode is set to manual, to avoid the overhead of calculating cells unrelated to the ...

Excel Recalculation | Microsoft Docs

Range.Calculate calculates the range one row at a time, left to right and top to bottom, and then resolves all dependencies within the range. This is the same method that Excel 2002 and Excel 2003 use, except that it has been enhanced to handle iterative calculations in manual mode.

Controlling Calculation from VBA - Decision Models

Probably one of your workbooks was saved while calculation was set to manual. If that is opened as the first workbook in a new session it will change the calculation mode for subsequent workbooks that are opened (irrespective of how they were saved). So look at that one, change calculation at application level to automatic and resave the workbook.
