works and how Boeing engineers made it happen. Contains line drawings and full technical specs.

The major objective of this book was to identify issues related to the introduction of new materials and the effects that advanced materials will have on the durability and technical risk of future civil aircraft throughout their service life. The committee investigated the new materials and structural concepts that are likely to be incorporated into next generation commercial aircraft and the factors influencing application decisions. Based on these predictions, the committee attempted to identify the design, characterization, monitoring, and maintenance issues that are critical for the introduction of advanced materials and structural concepts into future aircraft.

An inside technical look at the Boeing 777, one of the world's most advanced airliners. This volume features test flights, complex systems, revolutionary materials and structures, space-age cockpits and highly expensive engines.

A year after the disappearance and commencement of the international search for Malaysia Airlines Flight 370, no sign of the plane has been found—no debris, no bodies, no sign of the much-talked-about black box. Richard Belzer, George Noory, and David Wayne want to know why. Scrutinizing the theories the media and politicians claim are the “most likely” reasons the plane crashed, Belzer, Noory, and Wayne argue that if a year after a huge Boeing 777 has gone missing, and there’s still no sign of it whatsoever, it’s time to think outside the box. The public needs to stop being misled. If a plane and its passengers went “missing” once, what’s to stop it from happening again? Some of the theories the authors consider seem implausible on the surface, but the thorough research they’ve done and the continual failure of politicians, aviation authorities, and military members around the world to give any indication they’re wrong makes their arguments as good—if not better—than the more widely shared ones. The title of this thought-provoking volume, *Someone is Hiding Something*, is a line spoken by former Malaysian Prime Minister Mahathir Mohamad—perhaps the only government official to publicly acknowledge the true reason that neither Flight 370 nor the 239 people onboard have been found.

Documents the production of the passenger aircraft, examining Boeing's team management strategy, the design creation done exclusively on computer, and the unique financing plan

Most countries aspire to have a civil aircraft industry, but even in the best of times, success at civil aircraft manufacturing is difficult. Technological barriers, governments, and geopolitical considerations are only the beginning of the challenges faced by those aspiring to join the industry. In fact, only four companies in the world (Airbus, Boeing, Bombardier, and Embraer) have mastered manufacturing the extremely complex machines that are civil aircraft. In *Entering the Civil Aircraft Industry: Business Realities at the Technological Frontier*, Dr. Dean Roberts provides an insider's perspective of this fascinating, multifaceted, and challenging industry using his more than thirty years of experience and interest in all aspects of the field. Using in-depth case studies, he examines the interplay of industrial policy, high technology, globalization, and business strategy on the field of civil jet aircraft manufacturing, seeking out the reasons for policy successes—and failures.
