Rates of Chemical Reactions: According to present concepts, atoms or molecules react with one another only when they collide with sufficient force to overcome the initial forces of repulsion. The force required varies with the nature of the atoms or molecules; the more stable their initial state, the more forceful the collision must be.

Chemical equilibrium is a dynamic process consisting of forward and reverse reactions that proceed at equal rates. At equilibrium, the composition of the system no longer changes with time. The composition of an equilibrium mixture is independent of the direction from which equilibrium is approached.
